

Project Update: July 2016

This month, we held the first workshop "Tools for the Identification of Fish (cartilaginous)" with the fishermen. During this workshop we presented fisherman and volunteers with the necessary tools for species identification as well as data used for classification and identification of sharks and rays.

We had a great group of fishermen and volunteers - a total of 22 persons attended the workshop. During the workshop fishermen were very interested and participative asking many questions about shark and ray identification.

Also during this month we printed technical manuals and shark identification guides. The manual will be used to train fishermen to carry out monitoring of their catch in an orderly and systematic way, generating high quality data. All this material will be distributed and explained to fishermen and volunteers during the next workshops.
