

Project Update: March 2009

Read more about the findings of a new species of frog from SE Peru, discovered during fieldwork supported by the RSG Foundation. This frog is now the smallest frog in the Andes, and one of the smallest frogs; also among the tiniest high-elevation vertebrates. Because of these characteristics, the description has received some media coverage, including articles in major Peruvian newspapers, a slideshow on the website of Scientific American, and posting on many blog sites. Links to some of the pages are also below.
