Keywords: Wintering, shorebirds, January, North Sumatra, Indonesia

A survey of the wader populations was carried out at three sites in east coast of North Sumatra Province (Indonesia) during January 2009. A total of 27,869 waders were counted of 20 species. The east coast of north Sumatra province was shown to be an important site for East Asian-Australasian migratory wader populations particularly for Green Sandpiper, Terek Sandpiper, Lesser Sand Plover, Eurasian Curlew, Eastern Curlew, Black-tailed Godwit, Bar-tailed Godwit, Common Redshank and Asian Dowitcher which occur in concentrations exceeding 1% of the estimated East Asian Australasian flyway population. We recommend that east coast of North Sumatra province be designated as a Wetland International importance under the Ramsar Convention.

INTRODUCTION

Indonesia can be expected to be important for shorebirds during the non-breeding and migration periods, with birds on passage to Australia likely to pass through it on both northward and southward migration. Most internationally important sites recorded are in Sumatra (Bamford et al. 2008). However it is only during 1980’s-1990’s that detailed information on the distribution of coastal waterbirds has become available. In those years, large numbers of waders were recorded on the mudflats of the Southern Sumatra (Silvius 1988; Danielsen & Skov 1989; Verheugt et al. 1990; Verheugt et al. 1993). Crossland et al. 2009 reported sites of international importance for shorebirds in Asahan regency: in North Sumatra province. Other reports from the northern parts of Sumatra mostly recorded in small size numbers of shorebirds (Marle & Voous 1988; Ollington & Parish 1989; Holmes 1996; Crossland 2000; Crossland & Sinambela 2005; Crossland & Sinambela 2009; Crossland et al. 2006). Crossland et al. (2009) reported that the east coast of Sumatra province was an important area for refueling shorebirds on migratory as well as over wintering shorebirds for the East Asian Australian flyway. In this paper, we report our records for waders at three sites in the east coast of North Sumatra province on the non-breeding (over wintering) waders during 3-4 January 2009. This study confirms that the east coast of North Sumatra province is a significance habitat for shorebirds in the East Asian Australian flyway.

METHODS

Three selected sites were visited using small boats with outboard motors during 3-4 January 2009. Waders were counted during the low tide when they were present on the mudflat. Counting ended before high tide when the bird starting flying to roosts in the mangroves or inland plains. We found that the most effective method was to count from the boat as it was driven along the shores of the mudflat. Wide mudflats areas were counted by walking along the shore, using binoculars and telescopes to count the more distant areas.

Standard site description and waterbird count forms (Asian Waterbird Census form) designed and tested by Wetlands International were used for the surveys. Site description forms enabled data to be collected on types of wetlands, vegetation, uses of and threats to wetlands. Waterbird count forms provided a standard list of all waterbirds, against which numbers could be tallied (the standard list included other waterbirds; e.g. sandpipers, plovers, Redshank).

Study Area

Three selected sites were visited to conduct shorebird surveys along the east coast of North Sumatra province (Figure 1). East coast of Sumatra province was listed as one of Important Bird Areas by Holmes & Romabang (2001). The sites mentioned here are located following from northern to southern part of North Sumatra province; Tanjung Balai, Pantai Ancol and Bagan Percut.

Tanjung Balai (mouth of Asahan)

Tanjung Balai coast located in Bagan Asahan village, Tanjung Balai municipality, Asahan district north Sumatra province Indonesia. The area is very close to dense settlement because Tanjung Balai is capital city of district. However, good mangrove forest still occurs behind the mudflat. Tanjung Balai Asahan was visited in 3 January 2009.

Pantai Ancol

Pantai Ancol administratively is located in Rugemuk village Labu sub-district Deli, Serdang district, North Sumatra province. Pantai Ancol is a recreation area in Deli Serdang. It is easy to reach by car. Although a small mangrove forest still occurs, there has been considerable conversion of mangrove forest for fish ponds and recreation and their loss.
Wintering shorebirds along the east coast of North Sumatra

is a major problem for shorebird conservation in the future. Pantai Ancol was visited in 3 January 2009.

**Percut/Bagan Percut**

Percut or Bagan Percut is located administratively located in Bagan Percut Sei Tuan sub-district, Deli Serdang district. Percut is one of many birding sites in North Sumatra province. The area is very close to Medan, capital city of North Sumatra province. The mangrove forest is still present, and some large threatened waterbird (e.g. Milky stork *Mycteria cinerea* and Lesser adjutant *Leptoptilos javanicus*) are also found here. Percut was visited in 4 January 2009.

**SPECIES ACCOUNT**

An annotated list proved below provides details of waders recorded during survey on 3 January 2009. Distribution and number of species are also summarized in Table 1. The sequence and nomenclature of each species follow Sukmantoro *et al.* 2007 as reference for Indonesian birdlist.

**Common Greenshank *Tringa nebularia***

**Common sandpiper *Actitis hypoleucos***

Approximately up to 100 birds counted in Pantai Ancol on 3 January 2009. Widespread at each site in small numbers. Crossland *et al.* (2009) reported a maximum of 40 birds counted on Asahan River on 19 December 1995.

**Green Sandpiper *Tringa ochropus***

**Marsh Sandpiper *Tringa stagnatilis***

Marle & Vooos (1988) did not record this species in North Sumatra province. A total of 236 birds recorded in Pantai Sejara on 28 March 2008 (Crossland *et al.* 2009). There were at least 2 birds in Percut on 4 January 2009.

**Terek Sandpiper *Xenus cinereus***

Marle & Vooos (1988) did not record this species in North Sumatra province. There were 12 birds on 19 December 2005 in Asahan River and a total 254 birds from Pantai Sejara and West Tanjung Tiram (Crossland *et al.* 2009). A
total of 2750 birds were recorded from Pantai Ancol and Bagan Percut on 3-4 January 2009.

**Broad-billed Sandpiper Limicola falcinellus**

A total of 20 birds were observed in Bagan Percut on 4 January 2009. Marle & Voous (1988) reported only 2 specimens from Sumatra, collected on the coastal mudflats of North Sumatra from Belawan and Pantai Cermin.

**Pacific Golden Plover Pluvialis fulva**

A total of 400 birds were recorded at Pantai Ancol and Bagan Percut during this survey. Marle & Voous (1988) reported they were very common along the coast and in open country in lowlands and hills up to 1000 m at Balige, Lake Toba, North Sumatra province, usually in flocks of up to 50 or more. Crossland et al. (2009) did not record this species in their list but a total of 163 Grey Plover Pluvialis squatarola reported in Pantai Sejara and West Tanjung Tiram on 28 March 2002.

**Lesser Sand Plover Charadrius mongolus**

A total of up to 4050 birds were recorded during this survey. This is second largest number of waders observed during the survey after Common Redshank. Marle & Voous (1988) reported Lesser Sand Plover occurred from June-July 1979 in North Sumatra, in Deli Serdang. Crossland et al. (2009) recorded a total of 1520 birds at Pantai Sejara and West Tanjung Tiram on 28 March 2002.

**Kentish Plover Charadrius alexandrinus**

There were at least 100 birds of this species in Pantai Ancol on 3 January 2009. Marle & Voous (1988) recorded them at three sites in North Sumatra province without detail, Pantai Cermin, Deli Serdang and Perbaungan.

**Ruddy Turnstone Arenaria interpres**

Approximately 23 birds were recorded in Pantai Ancol on 3 January 2009. Marle & Voous (1988) did not record this species in North Sumatra province. A total of 224 birds were recorded from Pantai Sejara and West Tanjung Tiram on 28 March 2002 (Crossland et al. 2009).

**Eastern Curlew Numenius madagascariensis**

A total of up to 1700 Eastern Curlew were recorded from all sites during this survey. There have been no reports of this species from the Northern part of Sumatra (Marle & Voous 1988) since a record of 117 birds in mouth of Asahan River on 2 September 2006 (Crossland et al. 2009).

**Eurasian Curlew Numenius arquata**

A total of up to 3617 Eurasian Curlew was recorded from all sites during this survey. Marle & Voous (1988) reported the occurrence of this species from June-July 1979 in Deli Serdang, North Sumatra province. A total of 405 were recorded by Crossland et al. (2009) in Asahan River mouth on 25 September 2005.

**Whimbrel Numenius phaeopus**

A total of 750 Whimbrel from all sites were recorded during this survey. In Bagan Percut, the race *phaeopus* race was seen on 4 January 2009 in North Sumatra province (Figure 2). This is the second sighting for the *phaeopus* race, the first record being in June-July 2008 from South Sumatra (Iqbal & Ridwan 2009). Marle & Voous (1988) reported that Whimbrel occurred from June to July 1979 in Deli Serdang suggesting non-breeding summering. There was an inland record for Lake Toba on December 1988 (Holmes 1996). Crossland et al. (2009) reported 405 birds in Asahan River mouth on 25 September 2005.

**Note:** EAA = East Asian Australian Flyway (based on Bamford et al. 2008).
Black-tailed Godwit *Limosa limosa*

A total of 2700 birds were recorded from Pantai Ancol and Bagan Percut during this survey. There are a few previous records from Percut, North Sumatra (Marle & Voous 1988). (Crossland et al. 2009) reported up to 4465 birds in Pantai Sejara and Tanjung Tiram on 28 March 2002. The largest count for Black-tailed Godwit in South-east coast Sumatra province was of up to 43,000 birds on July-August 1985 (Danielsen & Skov 1989).

Bar-tailed Godwit *Limosa lapponica*

Up to 1400 birds were recorded from Bagan Percut and Pantai Ancol on 3-4 January 2009. A few records have previously been noted from North Sumatra from Tanjung Tiram and Percut (Marle & Voous 1988). (Crossland et al. 2009) counted up to 125 birds on 25 September 2005 in Asahan River.

Common Redshank *Tringa totanus*

Common Redshank was the most abundant wader counted during this survey with total of 4,500 birds. Records from North Sumatra province on June-July 1979 in Deli Serdang suggest non-breeding summering occurs (Marle & Voous 1988). Crossland et al. (2009) reported of up to 1256 birds on 28 March 2002 in Pantai Sejara and Tanjung Tiram.

Curlew Sandpiper *Calidris ferruginea*

Marle & Voous (1988) recorded this species at three sites in North Sumatra province in Belawan, Deli and Percut, but without detail. Crossland et al. (2009) reported a total of 546 birds from Pantai Sejara & West Tanjung Tiram on 28 March 2002. Two birds were seen in Pantai Ancol on 3 January 2009 and 5 birds in Percut on 4 January 2009.

Great Knot *Calidris tenuirostris*

Approximately 100 birds were recorded from Bagan Percut on 4 January 2009. There are no previous reports from Sumatra (Marle & Voous 1988) after 380 birds on Pantai Sejara on 28 March 2002 (Crossland et al. 2009).

Red Knot *Calidris canutus*

Five birds were recorded during this survey, but it may be possible that some birds went unrecorded among unidentified shorebird flocks. Marle & Voous (1988) reported a few birds on 7 June 1979 in small flock at Percut, North Sumatra. Approximately 400 birds were observed in Bagan Percut on 14 April 2007 (Crossland & Sinambela 2009).

Asian Dowitcher *Limnodromus semipalmatus*

During this survey, at least 550 birds were observed at Pantai Ancol and Bagan Percut on 3-4 January 2009. There are no previous reports from Sumatra (Marle & Voous 1988) after 7957 birds on 28 March 2002 in Pantai Sejara and Tanjung Tiram (Crossland et al. 2009).

**DISCUSSION**

With total up to 27,869 waders recorded from three sites in North Sumatra province, it is clear that east coast of North Sumatra province is important habitat and feeding ground for migratory non-breeding shorebirds in East Asian Australasian flyway. This survey data shows that nine migratory wader species; Green Sandpiper, Terek Sandpiper, Lesser Sand Plover, Eurasian Curlew, Eastern Curlew, Black-tailed Godwit, Bar-tailed Godwit, Common Redshank and Asian Dowitcher occur in concentrations exceeding 1% of the estimated East Asian Australasian flyway population (Bamford et al. 2008).

The largest count of shorebirds at the three survey sites was at Pantai Ancol where 15,540 shorebirds were counted (Figure 3). The second largest site was at Bagan Percut where there was a maximum of 7,852 shorebirds (Figure 4). The lowest density site was Tanjung Balai which supported 4,477 shorebirds. Large areas of the intertidal mudflats and coastal wetlands along the coast of North Sumatra remain unsurveyed. Crossland et al. 2009 predicted that during peak migration periods the entire coastline would support upwards of 100,000 waders. Verheugt et al. (1990) estimated 500,000 waders are dependent on the coastal mudflat of South...
Wintering shorebirds along the east coast of North Sumatra

Sumatra. Although estimated to support fewer birds than the South Sumatra coast the east coast of North Sumatra province is a significant area for migratory non-breeding shorebirds in the East Asian Australasian.

Beside large number of migratory shorebirds, the east coast of North Sumatra province supports sizeable populations of other waterbird including the globally threatened Milky stork *Mycteria cinerea* and Lesser Adjutant *Leptoptilos javanicus*. Some areas in North Sumatra Province are protected as conservation area or important conservation area (Wibowo & Suyatno 1997; Wibowo & Suyatno 1998). However, based on the occurrence of at least 27,869 waders, it is recommended that the east coast of North Sumatra province be designated as Wetland International Importance under the Ramsar convention to protect shorebird conservation in the area.

ACKNOWLEGMENTS
Field work in this survey is a part of Milky stork *Mycteria cinerea* population assessment in Sumatra, supported by Rufford Small Grant (RSG) with additional fund from WCS RFP (Wildlife Conservation Society Research Fellowship Programme) and equipment grant from Idea Wild. We would like to thank Rufford Small Grant Secretariat (Josh Cole and Jane Rufford), WCS RFP secretariat (William Banham, Ph.D., Kate Mastro, Lynn Duda and Dr. Nick Brickle), and
